Issues / Bugs

- Offer retraction bug
 - When users have multiple pending offers (awaiting to be accepted) and they go to retract any offer that they have made, only the last offer (that the user made) is retracted.
 - For example, say we have the following pending offers:

My Tasks

- We believe that the offer id (for the offer to be retracted) is getting changed/alterd to the offer id of the last offer in the array of offers. This could have been due to a combination of React rendering and/or TypeScript misinterpretation.
